

Modular Trigger Assignment

„Modular Trigger Assignment“ is an open form concept. It provides a notational template, which derives several musical modules, when a specific MTA-version (“gestalt”) is worked out. These modules serve as formal parts of the piece.

Each module is activated by a main-trigger. This is a concrete musical action, which is assigned to a specific player and which influences the musical behaviour of all other players. Each player is free to trigger his assigned module during a performance whenever and as often as he likes. The global form of the piece is built during the performance through the (unpredictable) succession of the different main-triggers.

The inner structure of each module (formal part) is determined by certain sub-triggers. Each player is able to influence the musical behaviour of another player through a sub-trigger. This creates a flexible musical structure, which varies each time the part is repeated in the piece.

For the execution of an MTA-gestalt (that means a concrete version) a definite instrumentation and a definite amount of modules has to be fixed. Then, concrete musical material (that means several more or less exactly described musical actions) is assigned to each module and the main- and sub-triggers are chosen. Furthermore one can agree on a musical or non-musical sign for ending the piece.

All the other necessary decisions are made by the players during the performance.

The notational template (module page):

On the top of the page you find the name of the “gestalt” and the instrument – below this the cardinal number of the module. The cardinal number has only the purpose to distinct the different modules and has no influence on their order.

The upmost box on the page shows the main-trigger. It is coloured red, if another player provokes the trigger. The accordant instrument is also announced. The player himself never plays the shown musical action in this case! However, if the box is coloured blue, the player is able to provoke the trigger himself, that means he can play the shown musical action whenever he likes.

Below the box you find two columns: left A and right B: After the main trigger was played, the player starts to choose and play any action from column A. He is free to choose the occurrence of the actions as well as their rhythmical placement. The lowermost action serves as a sub-trigger for another instrument, which is announced above in the little black box with the arrow. As long as the player stays in column A, he can play the sub-trigger whenever he likes in order to influence the musical behaviour of the other instrument.

The lowermost box shows the sub-trigger. It is coloured violet and announces the instrument, which is playing the sub-trigger. Here again the player himself never plays the shown musical action! If the player hears that action, he has to

change the column immediately. That means if he was playing actions from column A in the moment, he now changes to column B and vice versa. As long as he stays in column B he cannot provoke a sub-trigger.

During a performance several players are going to play their assigned main-triggers several times. This is the sign for all the players to change to the accordant module page and to play the musical actions and sub-triggers on this specific page as explained above. Thus, the placement in time and the occurrence of the triggers is the crucial factor for creating the form and structure of the piece and demands highest attention of the players.

Explanations

General Explanations

The player can choose the number of repetitions of the quarter notes. It can even be less than three, if it musically makes sense. The tempo is basically free, but not too fast.

any order of tones,
irregular rhythms

The player chooses from the given tone material and plays short staccato phrases in irregular rhythms. The tempo is free and shall vary constantly.

Explanations for the reed instruments

tongue ram

The tongue "rams" against the reed.

overblow gliss.

Short ascending glissando, starting from a relatively high overblowed tone.

overblow gliss. + growl

Very expressive "free jazz" action. Starting in the middle register with growl voice and playing a long, ascending overblow glissando.

tongue whisk

The tongue "whisks" on the reed in a horizontal fast movement. No actual tone is produced, but a repetitiv "clicking" sound.

air into mouthpiece

Blowing air into the mouthpiece without producing an actual tone. Tongue is in positions like saying "sh".

air onto mouthpiece

Blowing air onto the mouthpiece without producing an actual tone. Tongue is in positions like saying "s".

"kiss"

"Kissing" the edge of reed and mouthpiece. A short, squeaking sound is produced.

slap without tone

Dry slap without fixed embouchure.

Ordinary flutter tongue.

flutter tongue between teeth

Flutter tongue between the teeth and on the reed, producing a "machine gun" sound.

as high as possible

Trill on a tone as high as possible.
The tone may be produced with the teeth on the reed.

Explanations for the string instruments

Damping all the four strings with the left hand so they can not resonate. Be cautious that no actual tone or harmonic is produced if the bow touches the strings.

pizz. in pegbox /
pizz. behind bridge

Choose any string in the pegbox resp. behind the bridge for pizzicato.

Dry Bartok pizzicato.

strong bow pressure

Short action with very strong bow pressure. A perforated sound is produced.

slide with strong bow pressure

Bow with very strong pressure slides diagonal across the fingerboard in direction of the bridge and first string. A perforated, changing sound is produced.

legno saltando

Throw the bow stick on the strings and let it bounce until the movement ends naturally.

arco saltando

Same as legno saltando but with the bow hairs instead of the bow stick.

arco on corpus/bridge

Bowling on the body of the instrument resp. on the bridge. Avoid squeaking sounds!

cloth on corpus

Whisk a piece of cloth on the body of the instrument in a rotary movement.

damped pizz.

Choose any string for a dry pizzicato without actual tone.

flip finger on corpus

A dry click sound is produced.

as high as possible

Producing a tone as high as possible on the instrument, if required as an harmonic.

Ordinary tremolo.
